THE PROPOSAL

An India GCC decision you can explain.

GCC Atlas connects a city scenario, selected providers and supporting evidence in one saved brief.

For the first India centre

A strategy or operations leader preparing a shortlist for internal approval.

Built and working

Compare four cities, inspect sources, shortlist providers, then save and export.

The hard part is joining the pieces.

A new entrant must combine company examples, hiring data, costs and referrals into one decision.

Definitions differ

Companies, individual centres and hiring plans describe different things. Dates and scope change the comparison.

Incentives differ

Advisers, recruiters, landlords and governments each see one part and have their own commercial objectives.

Approval needs reasoning

The buyer must explain why a city and provider fit, which assumptions matter, and what still needs checking.

One buyer. Many people holding the answers.

Who	What they know / need	Effect of uncertainty
Strategy / finance leader	Location, budget, ownership and approval	A shortlist that is hard to defend
Talent / GCC leader	Role mix, pay and hiring pace	Headline medians may miss the actual team
Adviser, lawyer, auditor	Structure, compliance and tax	Case-specific dependencies remain unresolved
Recruiter, EOR, property firm	Hiring, employment and workspace	Quotes and delivery claims need comparison
State agency	Policies and local incentives	Eligibility depends on the company's plan

Stakeholder map derived from the assignment; effects are hypotheses to validate

Small input choices can change a large budget.

Illustration: 40 software engineers × Flexiple's dated annual salary medians, before overhead and office costs.

₹6.28 cr

Bengaluru salary arithmetic

₹3.04 cr

Chennai salary arithmetic

₹3.24 cr

Difference between these inputs

> This is cost exposure in a demonstration—not proven savings, equivalent talent availability, or the cost of a wrong decision.

40 is a demo team size; ₹15.7L / ₹7.6L medians from Flexiple, Aug 2026

Salary reference

Flexiple already has much of the information layer.

Directory and announcements

A sourced, filterable GCC directory and new-centre information. Our smaller directory alone adds little.

City and talent intelligence

Six-metro comparison tables, role information and salary benchmarks. City data is already part of their offer.

Setup and execution

Flexiple advertises city-selection advice, entity setup, hiring, workspace and payroll support.

> Proposed addition: a self-service, saved decision brief joining the buyer's inputs, provider evidence and unresolved questions.

Public pages reviewed 13 Oct 2026 · private/client tools were not audited

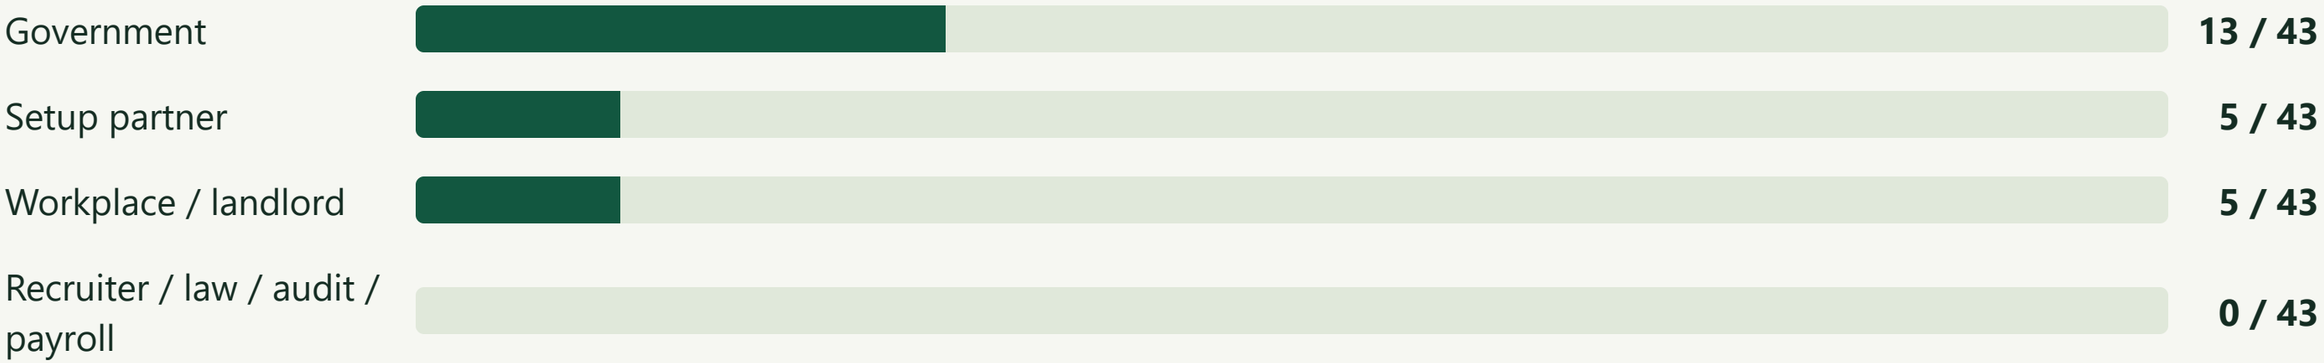

Directory · GCC services

Information is useful. The handoff is still work.

Alternative	Useful for	Question Atlas would address
Directories and reports	Finding companies and benchmarks	Which evidence matters for my exact decision?
Advisers and referrals	Context and specialist judgment	Can I retain the reasoning and compare claims?
Provider service pages	Discovering offerings	Which role is documented, and what is unproven?
Spreadsheets and internal briefs	Modelling and approval	Can inputs, sources and provider choices stay together?

Public product review + proposed buyer workflow; no entrant interviews yet

A named relationship is useful. It is not a quality score.

> 22 of 43 announcements name none of these outside parties. Missing mention means unknown—not unused.

Counts derived from the existing checked 43-announcement corpus; roles can overlap

Prioritise the decision workflow. Keep evidence underneath it.

1 · City + provider brief

One complete buyer task with an output they can inspect and revisit. Validate whether it helps a real approval.

2 · Source-linked evidence

Dates, exact roles and unknown fields make the brief reviewable. Reliability is a dependency, not a decorative feature.

3 · Alerts and introductions

Potential recurring use and commercial handoff after demand, freshness and trust are established.

03 · FIRST CUSTOMER

Start with the person preparing the first India shortlist.

A strategy or operations leader at a midmarket global company, preparing an internal decision with finance and talent colleagues.

Their job

Compare locations, identify setup conversations and show management the reasoning and remaining risks.

The first output

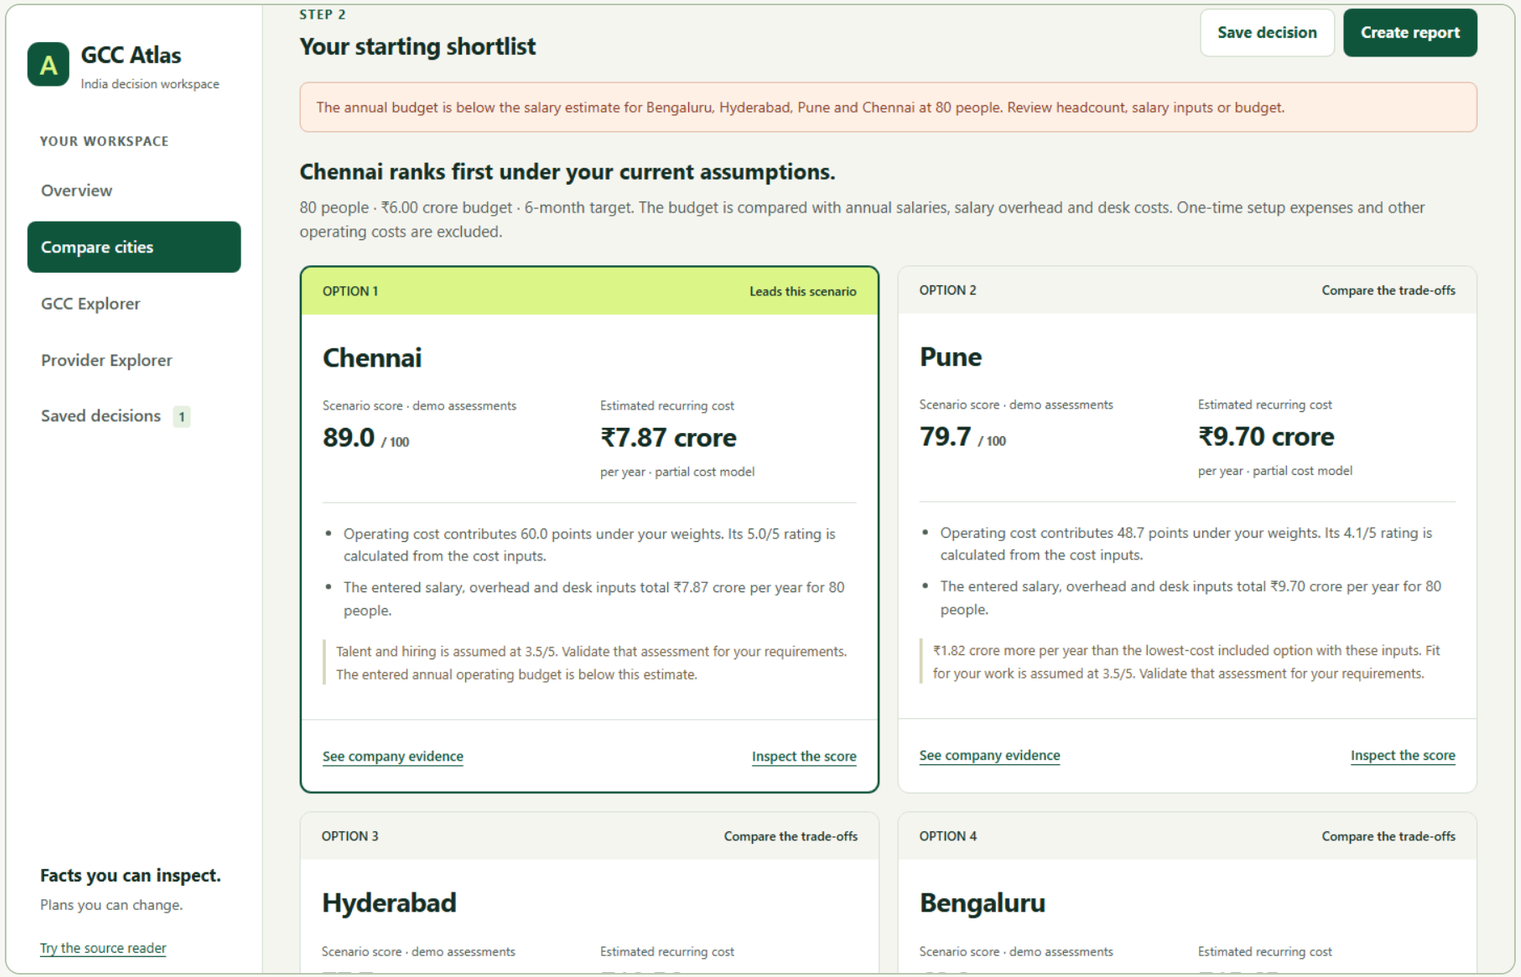

A saved brief: requirements, city scenarios, chosen providers, evidence links and open questions.

The entry condition

They have a plausible role mix and budget. Exact hiring feasibility and legal advice still come from specialists.

Initial segment hypothesis; an adviser supporting the buyer is a secondary user

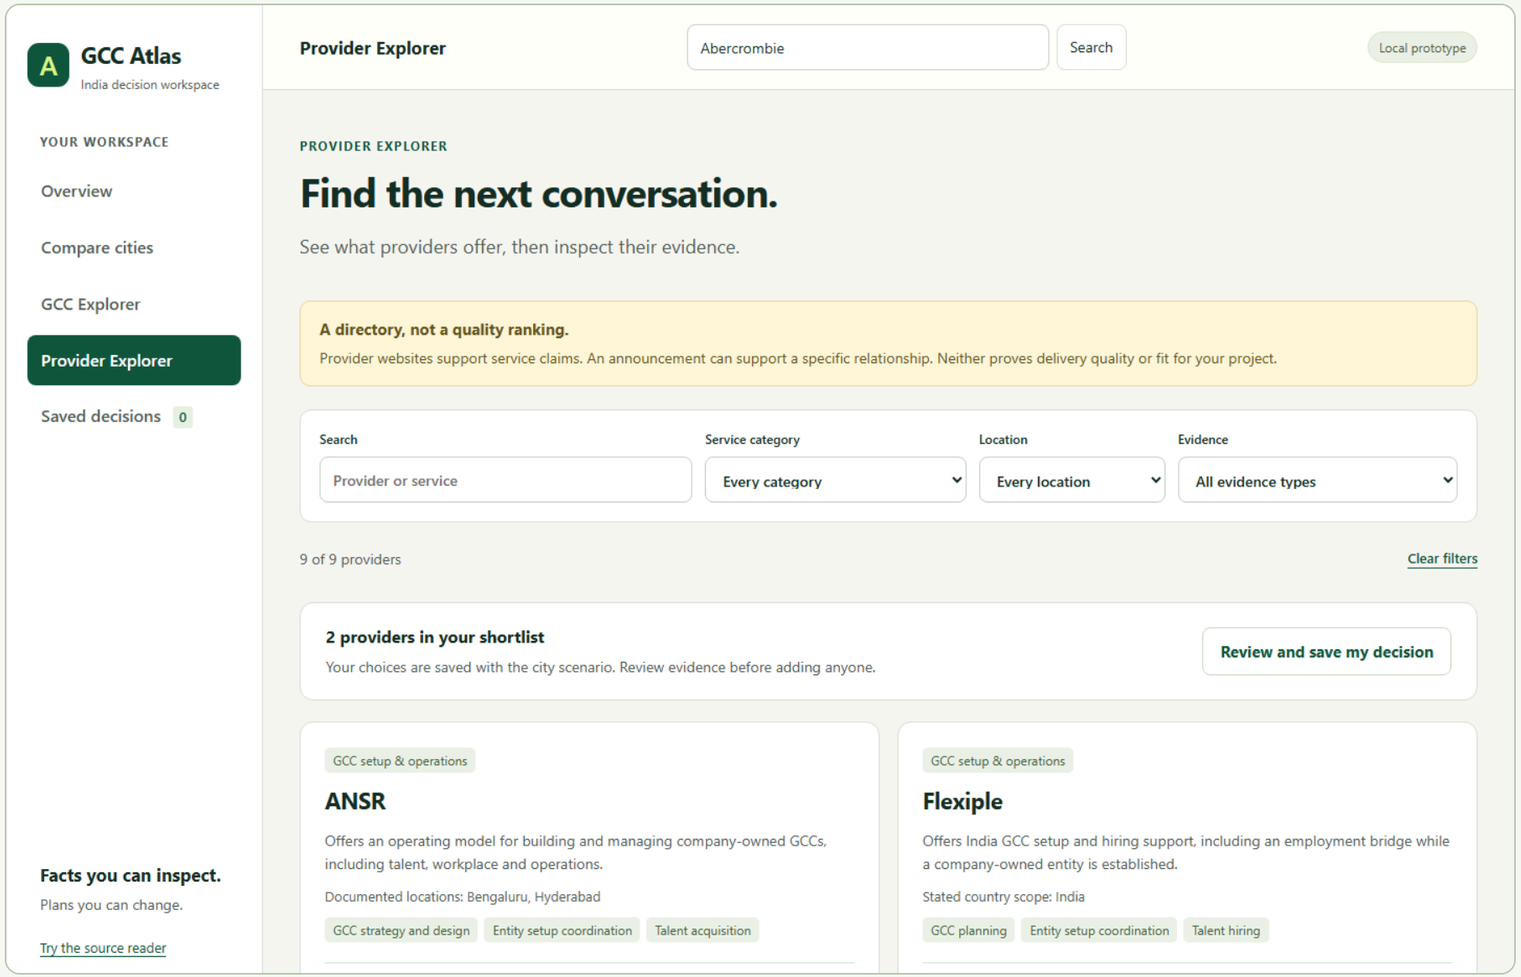

Change the inputs. See the trade-offs change.

- Four cities; headcount, annual budget scope, priorities and exclusions.
- Editable weights and assessments; inspect each score contribution.
- Budget warnings and source links; save or export the exact assumptions.

Actual prototype screenshot · example ratings are not measured city performance

Carry provider evidence into the same decision.

- Filter nine providers by service, location and evidence type.
- Inspect source-named roles separately from provider-stated services.
- Select providers, reopen them with the scenario, and export questions to ask.

Actual prototype screenshot · selected by the buyer; no quality ranking or contact sent

Facts, references and assumptions stay visible.

Sourced records

43 announcements retain quotations, source dates and check status. Nine providers retain claim-specific evidence.

Dated references

Starting salaries are Aug 2026 software medians. They are not quotes for every role, seniority or hiring timeline.

Editable demo inputs

Non-cost ratings, desk costs, overhead and weights are examples. No incentive savings or setup guarantees enter the model.

> Scenario score = sum of (rating ÷ 5 × weight share × 100). Cost rating follows the entered recurring costs.

The workspace between research and the adviser conversation.

Stakeholder	Reason to try Atlas	What still needs validation
Entrant / finance leader	Reproducible scenarios and a source-linked approval brief	Does it replace work they actually do?
Talent or GCC leader	Visible role assumptions and diligence questions	Does evidence match the hiring plan?
Adviser	Reuse inputs and inspect the buyer's reasoning	Would it fit the existing client workflow?
Provider	A relevant conversation grounded in a specific role	Will they share references and outcomes?
State / property ecosystem	A route to contribute dated local evidence	Will updates be reliable and comparable?

Earn trust before monetising the handoff.

Discovery

Free source-linked intelligence and a usable decision journey could attract entering companies.

Paid research hypothesis

Charge for a decision project or recurring adviser workspace only if buyers value richer evidence and monitoring.

Disclosed introduction

Optional handoff to Flexiple or another provider after explicit buyer consent; no hidden effect on scores.

> Flexiple is a provider too. Publish commercial relationships and apply the same evidence rules to every listed firm.

Use AI to work faster. Keep decisions inspectable.

AI-assisted build

AI supported research, product debate, code, documentation and browser checks. Findings were checked against sources.

Grounded extraction experiment

The preserved reader checks proposed quotations against supplied text. Live Claude access is environment-specific and unverified in the real Artifact.

Reliable fallback

Atlas calculations and explanations are deterministic. No API key is needed; sample extraction is labelled, not presented as a live response.

06 · VALIDATE AND LAUNCH

Test whether the brief changes a real decision.

First · Understand the work

Interview entrants and advisers. Inspect their recent decision briefs, purchases, source conflicts and unresolved questions.

Then · Test this journey

Observe completion, evidence inspection, explanation of rankings, saved/exported briefs and decision usefulness.

Next · Replace weak inputs

Add role-specific hiring evidence, current office quotations, official policy eligibility and permissioned outcome references.

> Main risks: stale evidence, misleading precision, biased provider incentives and a workflow buyers do not need.
